Points and response bands: conditional MC 95%. Curves: broad-window quadratic fits; shading is not total model uncertainty.

Bars/bands: conditional MC 95%; fixed $\omega = 0.789$ is WF-informed. Size cuts are alternatives, not independent measurements. 6 : 12 is unresolved.

Bars: conditional MC 95%. Open circles: unresolved roots; red crosses: rejected response shape. Rows reuse correlated data.
Unresolved intervals use surviving draws. Dotted line: XY Monte Carlo benchmark, 0.519050 (Hasenbusch, 2019).
