Measured response: four starts; vertical spans show split-half variation
ε/π = 0.52, 12³
ε/π = 0.51, 12³
ε/π = 0.505, 12³
uniform zero-winding
unit-x winding
near-saturated checkerboard
vortex-rich parity-locked Z4
$U = 1 - \langle m^4 \rangle / (2\langle m^2 \rangle^2)$
κ
Spans are descriptive half-to-half variation, not statistical error bars. Purple windows are measured common brackets.
The q=0.505 cohort uses exact local heatbath; earlier Metropolis cohorts remain preserved separately.
