Strong-negative scan: does the response align at fixed u?
κ = -4, N = 6
κ = -8, N = 6
κ = -16, N = 6
Sampled max spin Fourier power
Staggered nematic power
Vortex density
$u = |\kappa|(\varepsilon - \pi/2)$
Uniform
Unit winding
Canted sublattices
Vortex-rich Z4/parity-locked
Each line is one initial-condition class, with independent seeds at its coordinates; lines guide the eye.
Shading spans two-half means, not confidence intervals. Fourier maxima are sampled every50cycles.
The u grid tests a hypothesis; no collapse, equilibrium, transition coupling or asymptote is assumed.
